

MMC Tendos with CDP pump control

MMC Tendos has made a multitude of vacuum pump systems and well tank systems for fish processing plants, fishing vessels and live fish transport vessels. All have CDP-based control systems

CDP is used to control the mechanical parts, engine temperatures, pump pressure and also the logistical transport system for moving fish inside large fish processing plants and onboard processing vessels or live fish transport vessels.

The systems have graphic screens for the operators which eases the operation of the system, by showing pump operation and water (and fish) flow through the system.
